

API - Consignment Supporting Document

This document is used to give a broad definition of all of the possible fields in the body of the Create a New Consignment API call and API request limitations.

This document breaks down the POST call into the different sections available and defines the fields available in those sections with the following attributes:

Attribute	Description
Field Name	The key used to define the field in POST data for allocation in Scurri.
Description	What the field represents in Scurri.
Character Type	The data type accepted for the field.
Field Length	Populated if there's a character restriction on the field within Scurri. Please note carriers may have further restrictions.
Mandatory	Whether the field is required or not in the API call in order to create a consignment in Scurri. Please note carriers may have further requirements surrounding what information is mandatory in order to generate a label.
Example	An example of how the value for the field may look.

Consignment Details

Options

The options area is used to submit the enhancements which are specific to a Carrier & Service. Enhancements options can be found by calling the '[List all the carrier services for the logged in user](#)' call.

This section is only required if you are not using Scurri rules to allocate Carrier, Service and Enhancements.

Invoice

Field Name	Description	Data Type	Mandatory	Example
<code>incoterm</code>	The trade term associated with the shipment	String	N	DDP

This section is only required if you are not using Scurri rules to allocate Carrier, Service and Enhancements.

API Request Limitations

The Scurri API has a maximum API request limit. Anything over the request limit will result in the API request being rejected.

- For a manifest request, the Scurri API will accept up to 50,000 consignments per request.
- In a GET request, the maximum value for limit is 1000, anything above this will cause performance issues and will be rejected.
